

Answer 1A) Stomach: Breaks down food using acids and enzymes. Small Intestine absorbs nutrients from the digested food into the bloodstream.

Answer 1B) Plant cells have cell walls and chloroplasts, which were absent in the animal cells. These structures help the plant maintain shape and carry out photosynthesis.

Answer 2A) Photosynthesis is the process by which green plants make their own food using sunlight, carbon dioxide, and water. It produces glucose and oxygen, which is essential for animals and humans to breathe.

Answer 2B)
